

Fork Positioner for Forklifts

Fork Positioner for Forklift - A fork positioner is an apparatus constructed out of high quality materials meant to be able to endure the most challenging procedures and work environments. This particular piece of equipment can enable the one driving to work the blades hydraulically without leaving the seat. Side shifting units have the added ability to be able to laterally position the entire load or the arms in order to facilitate much more accurate lifting and placement in a quicker and much more efficient method.

The unique fork pocket design can enable the person operating it to be able to securely sway the unit's blades without any fear of damaging the positioning cylinders. This can allow the operator the alternative to either perform independent or simultaneous blade movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
